

Hybrid Commercial Vehicles Report

The Hybrid Commercial Vehicles Report looks at the different types of commercial vehicle hybrids currently available on the market. It provides detailed coverage of the market drivers along with in-depth analysis of the latest technology. It also examines Flywheel based hybrids, Electric hybrids and advanced battery technology. Furthermore it details the latest OEM Technologies and Strategies by manufacturer.

Background to this Research

Around the world, a number of issues are combining to bring about a growth in demand from vehicle operators. Rising fuel costs mean that it is increasingly important to optimise truck drivelines, while at the same time meeting today's emission standards and those of tomorrow becomes more difficult.

The next few years will see increased cost and complexity within mainline commercial vehicle powertrain as manufacturers introduce technologies to comply with more stringent emissions regulation.

Table of contents

Introduction

Types of commercial vehicle hybrids

Market drivers

- Operating costs
- Emissions
- Hybrid market development
- Duty cycles

CV Hybrid Technology

- Types of hybrid system
- Hydraulic hybrid systems
- Eaton's Hydraulic Launch Assist™ (HLA®)
- Bosch-Rexroth's Hydrostatic Regenerative Brake System
- Other hydraulic hybrid systems

Flywheel based hybrid

Electric hybrids

Key components and systems

GM-Allison 2 mode system

Siemens ELFA system

ArvinMeritor Dual-Mode drivetrain

BAE Systems HybriDrive

Advanced battery technology

Current battery manufacturing trends

Nickel-metal hydride (NiMH)

Sodium nickel chloride (NaNiCl)

Lithium-ion

Li-ion technology improvements

Supercapacitors and ultracapacitors

Electric motors

Switch reluctance machines

OEM Technologies and Strategies

Daimler

Volvo

Scania

MAN Nutzfahrzeuge

Paccar

Iveco/ Irisbus

Navistar
